# Human-Robot Collaboration

- Robots that robustly perform actions in real-world environments.
- Robots that carry out complex sequences of actions.
- Robots that actively coordinate with people, establishing a social feedback loop.

Ruler

# Conventional Approaches

- Category-based grasping (Saxena et al. 2008)
  - Automatically infer object category and grasp points from sensor information.
  - Does not work well on novel objects.
- Instance-based grasping
  - Manually collect images and annotate grasps.
  - Highly accurate if you have enough data.

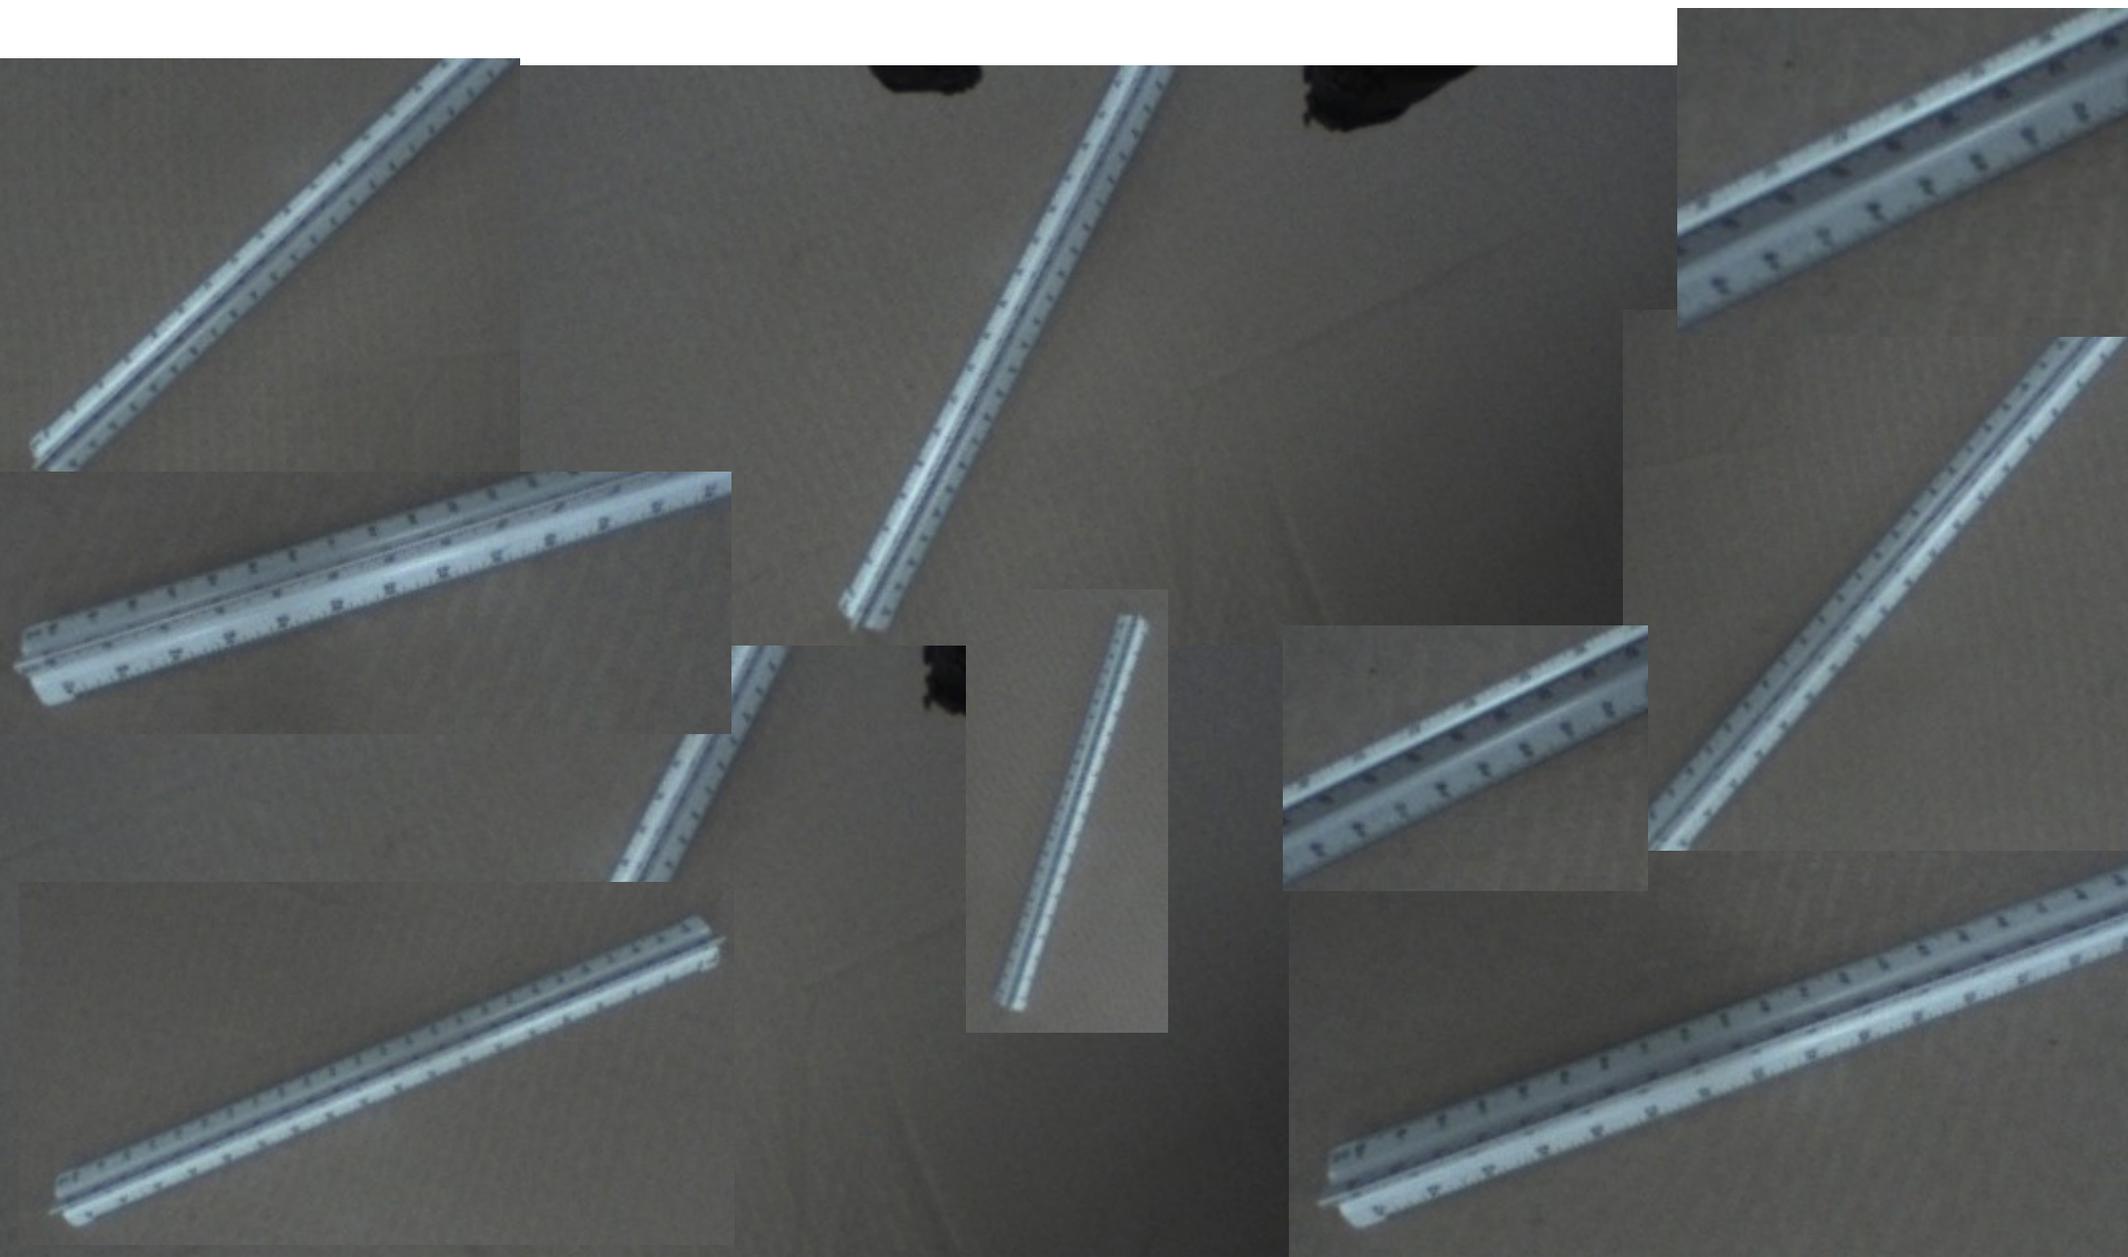

# Autonomously Collecting Data

The contribution of this work is an approach that enables a robot to autonomously collect the data that it needs to robustly manipulate objects.

# How can the robot learn to grasp challenging objects?

- Physical dynamics, such as the ruler twisting out of the gripper.
- Objects that are poorly visible in IR.

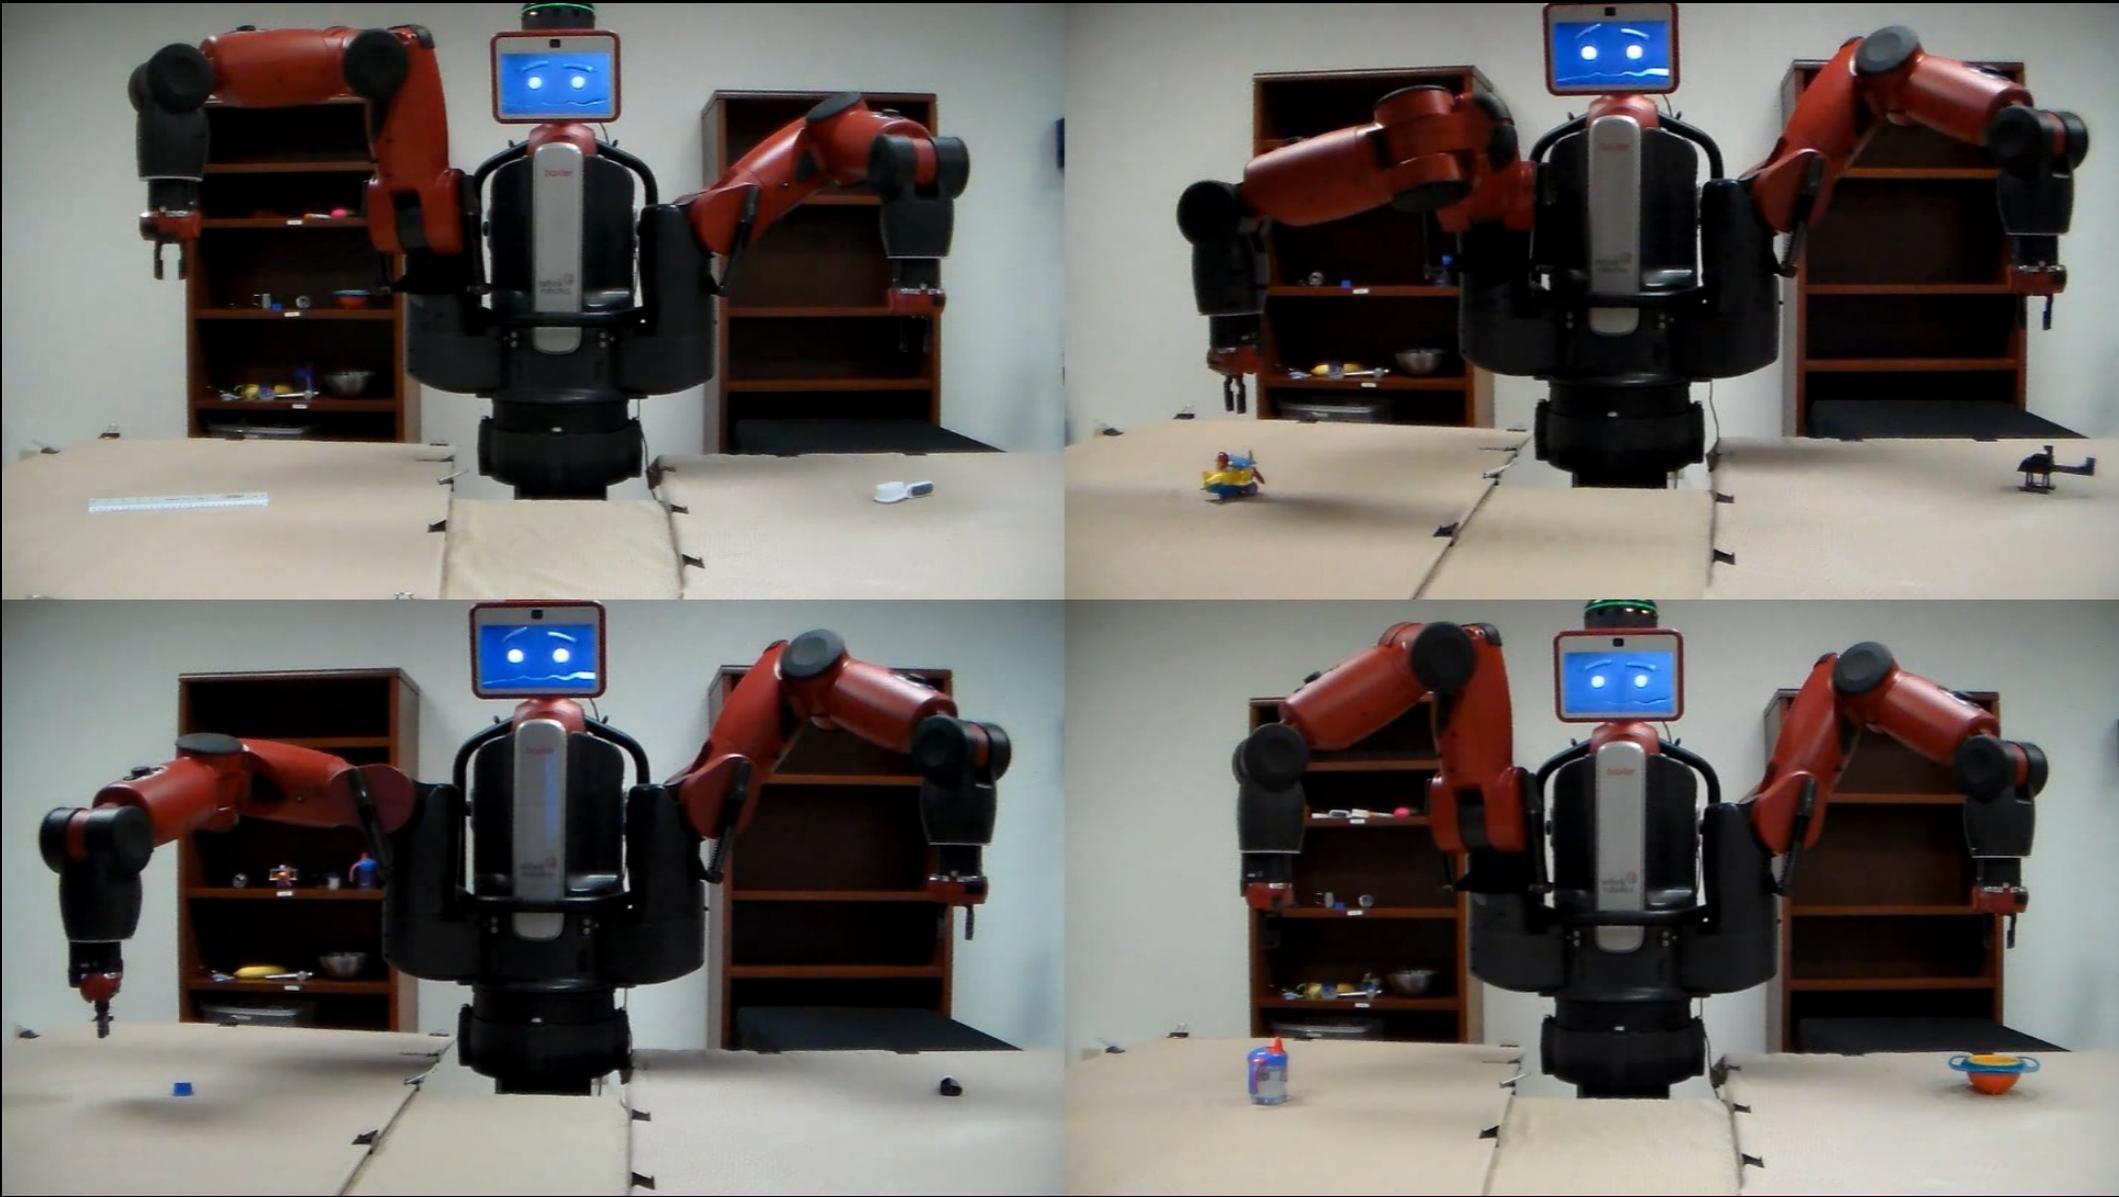

# N-armed Bandit

- Each grasp point and orientation is an arm with an unknown payout probability,  $\mu$ .
  - 1cmx1cm grid plus four orientations.
  - 1764 arms
- Best Arm Identification:
  - Given a budget of training trials, find the best arm as quickly as possible.

“Raise the forks 12 inches. Line up either fork in front of the dime. Tilt the forks forward 15 degrees. Pull the truck forward until one fork is directly over the dime. Completely lower the forks. Put the truck in reverse and gently travel backward a foot. The dime will flip up backwards onto the fork. Level the forks back to 90 degrees. Raise the dime with the forks 12 inches.”

# Human-Robot Collaboration

- Robots that robustly perform actions in real-world environments.
- Robots that carry out complex sequences of actions.
- Robots that actively coordinate with people, establishing a social feedback loop.

# Symbol Grounding Problem

“The pallet of boxes on the left.”

another tyre pallet on the trolley.

Place the pallet of tires on the left side of the trailer.

lift the tire pallet to the truck

Arrange tire pallet to the truck.

Please lift the set of six tires up and set them on the trailer, to the right of the set of tires already on it.

Load the skid right next to the other skid of tires on the trailer.

Place a second pallet of tires on the trailer.

Place the pallet of tires that is on the forklift next to the pallet of tires that is already loaded on the trailer.

Lift tire pallet. Move to unoccupied location on truck. Lower tire pallet. Reverse to starting location. Lower forks. End.

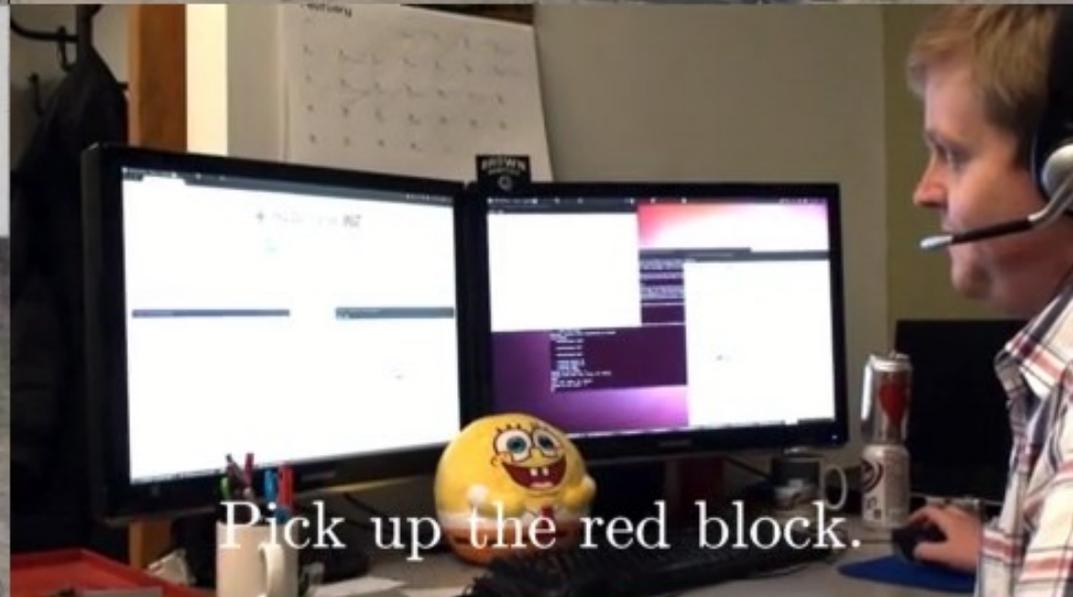

Put the tire pallet on the trailer.

Lift the tire pallet in the air, then proceed to deposit it to the right of the tire pallet already on the table right in front of you.

Place the pallet of tires on the right side of the truck.

Lift the tire pallet and proceed forward to set it on the platform directly ahead, to the right of the tire pallet already there.

Move the pallet from the truck.

Remove the pallet from the back of the truck.

Offload the metal crate from the truck.

Pick up the silver container from the truck bed.

# Social Feedback

- Humans constantly coordinate with each other to establish common ground.
- In one study (Clark & Krych, 2004), one human instructs another to assemble objects:
  - 2x slower when they cannot see each other or see the workspace.
  - 8x more errors without feedback.

# Incremental, Real-Time Interpretation of Multimodal Communication

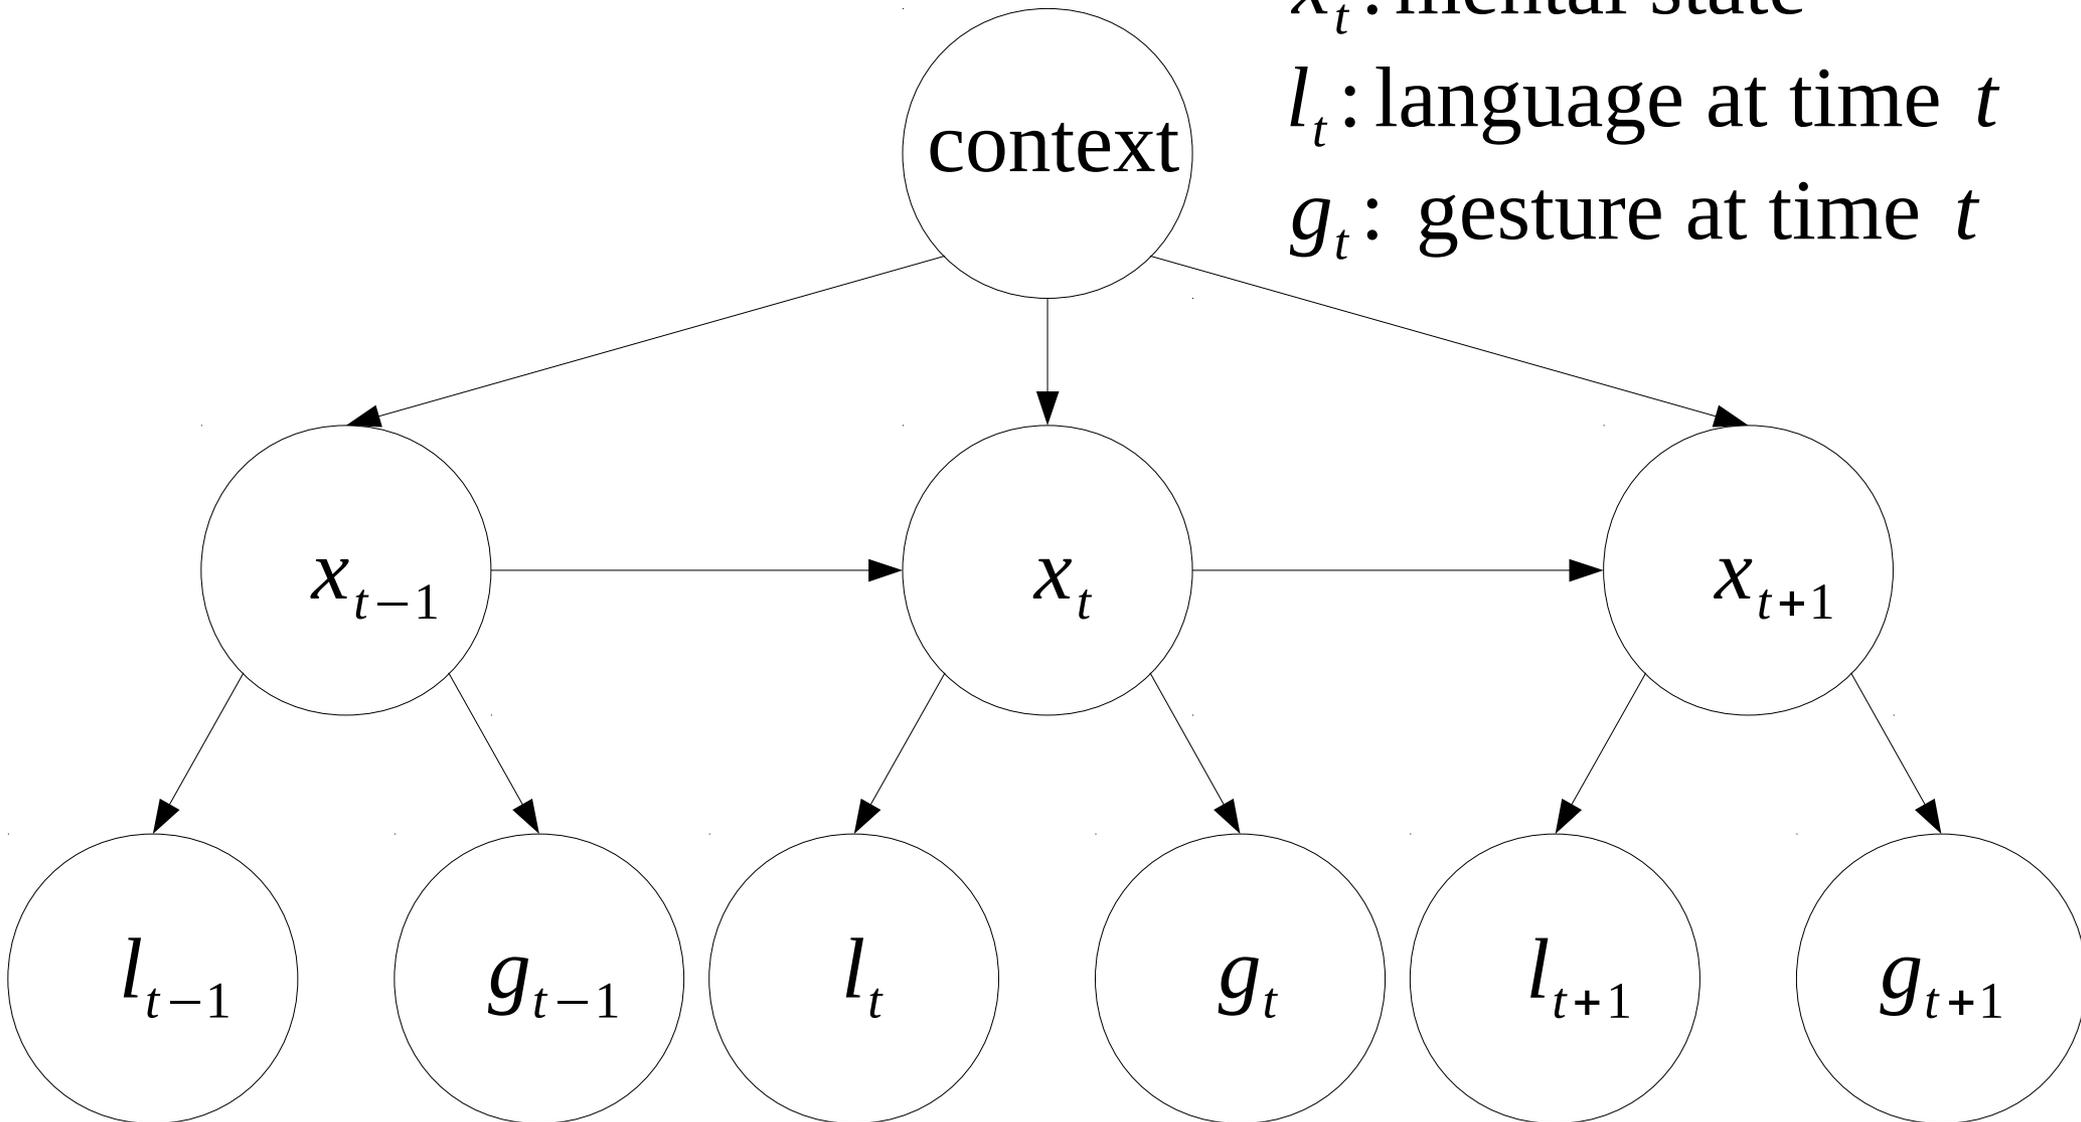

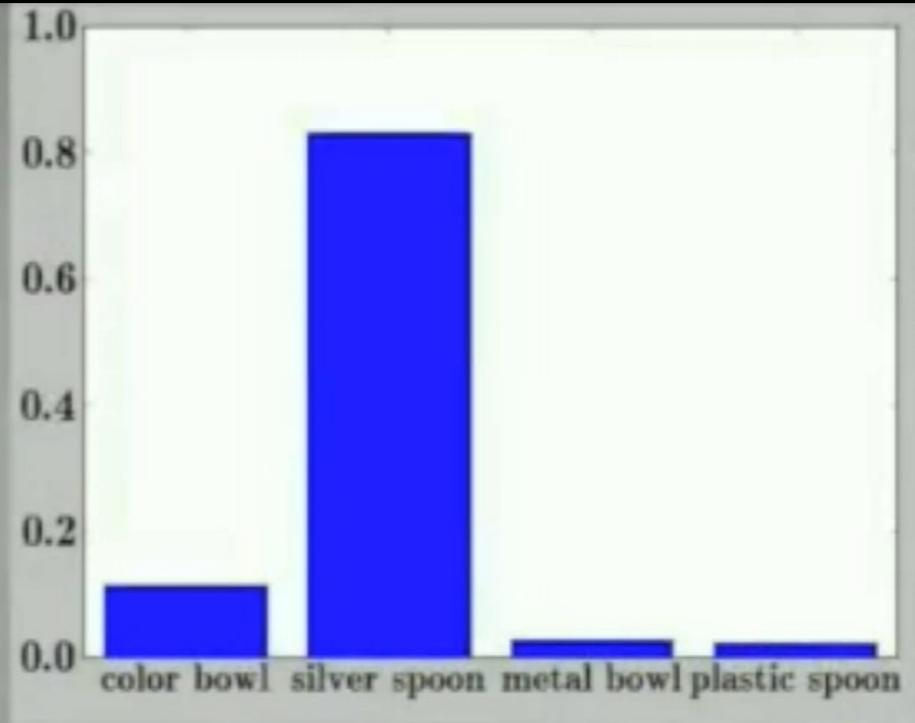

# Bayes Filter

$x_t$ : mental state

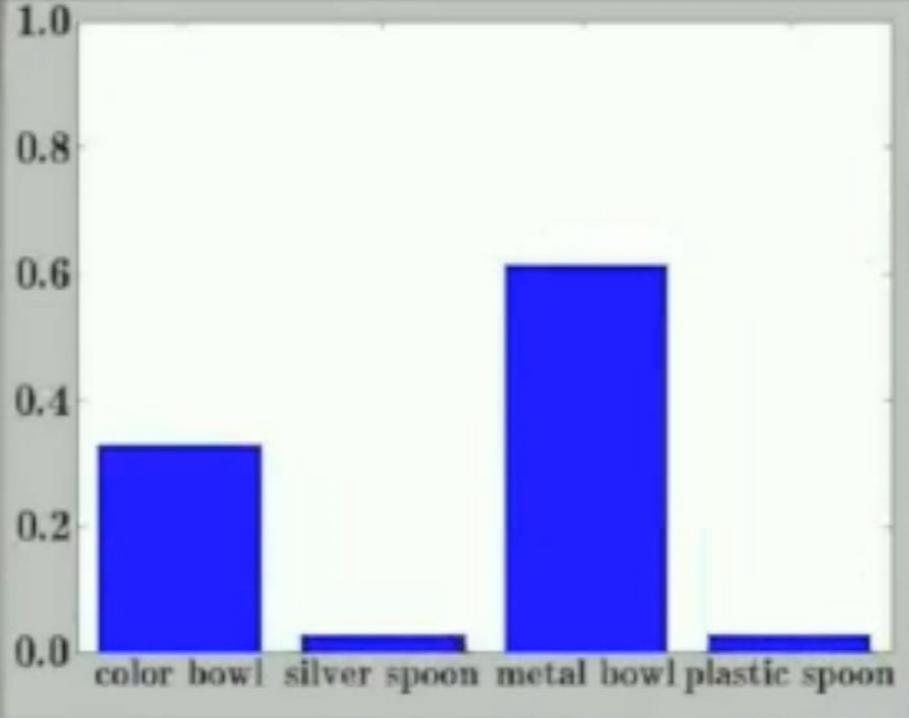

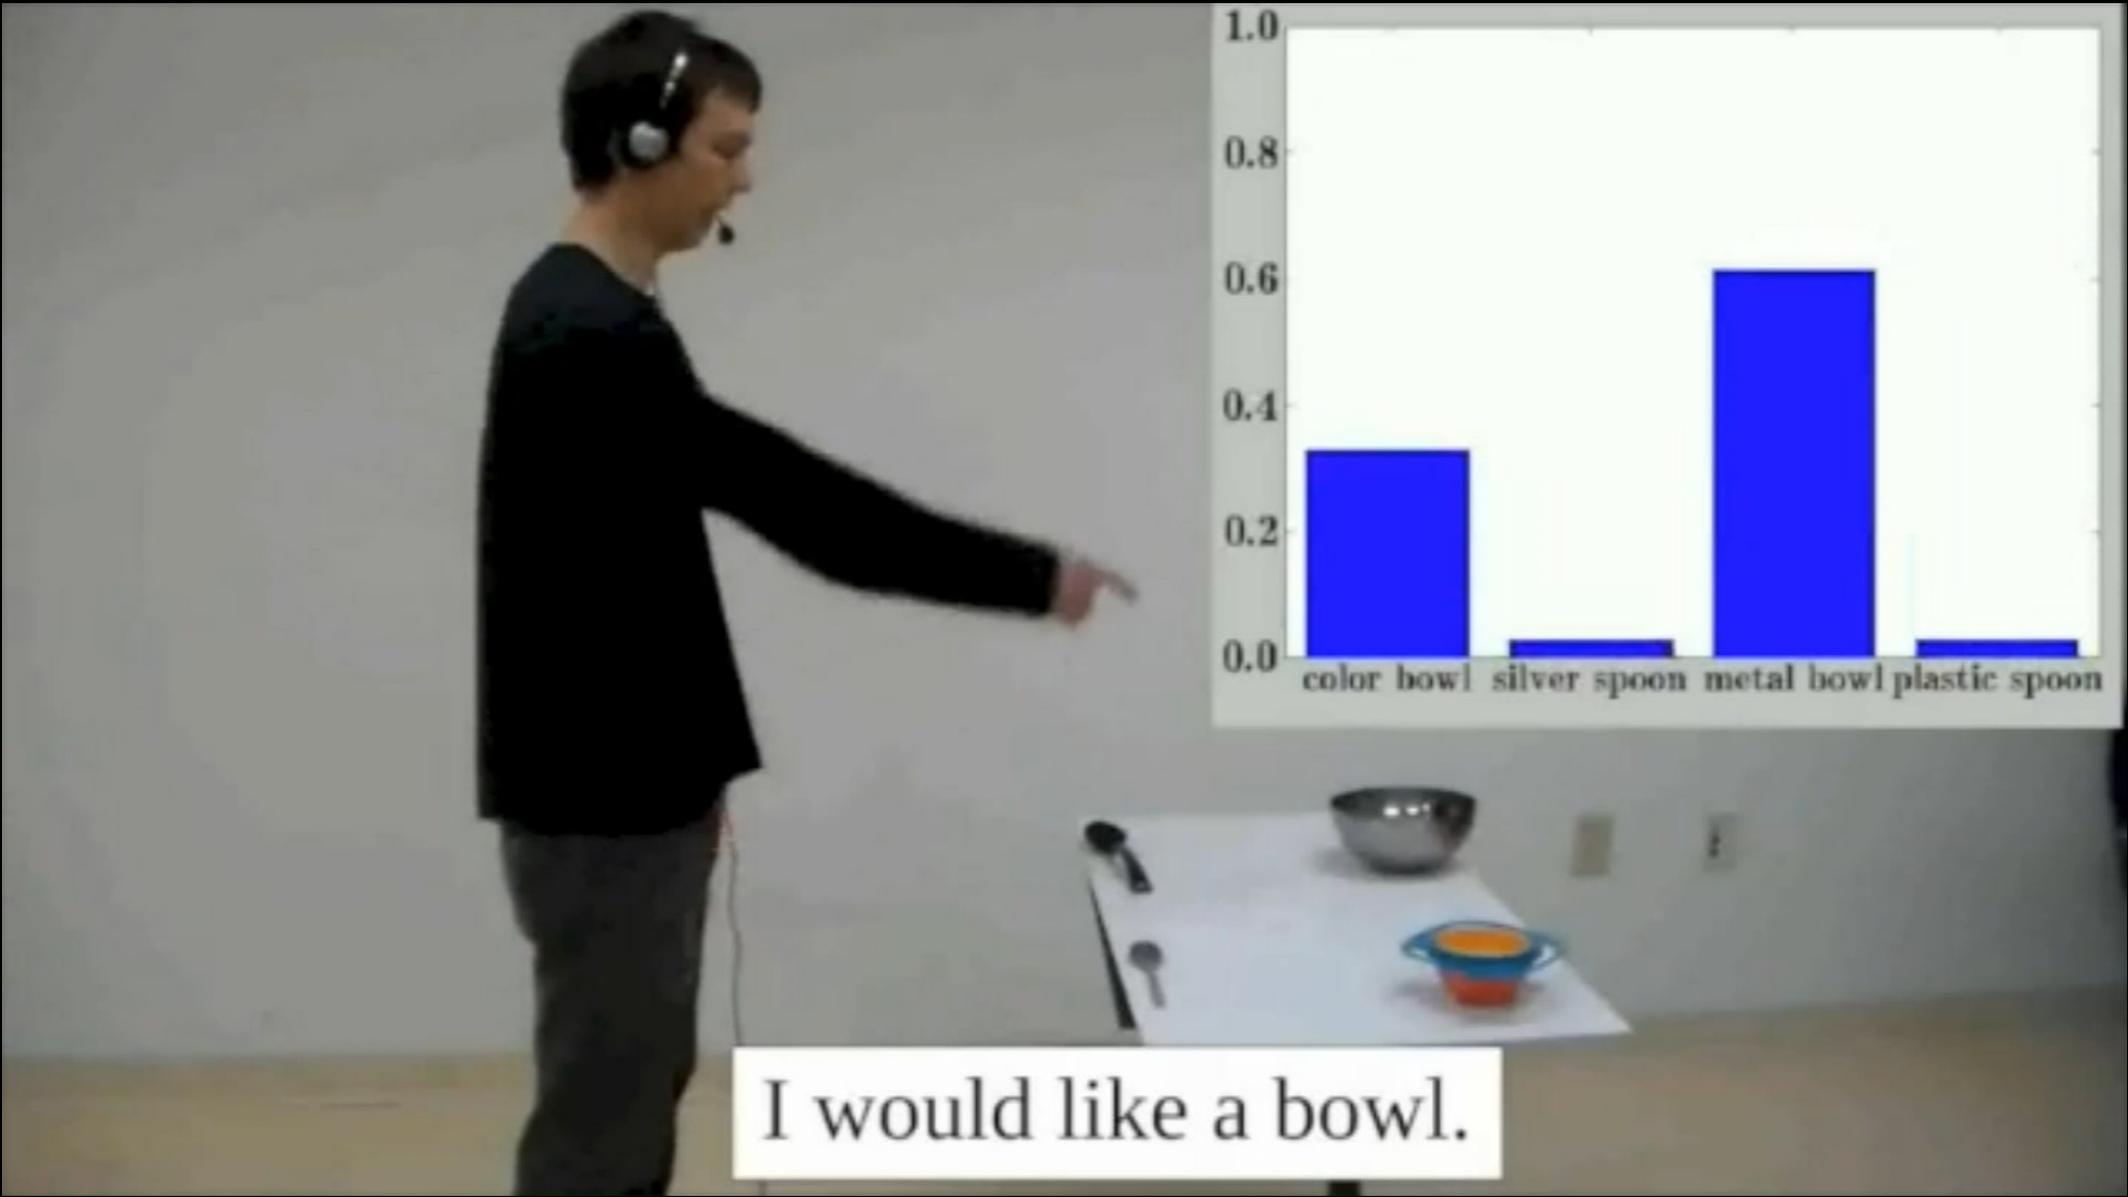

$l_t$ : language at time  $t$

$g_t$ : gesture at time  $t$

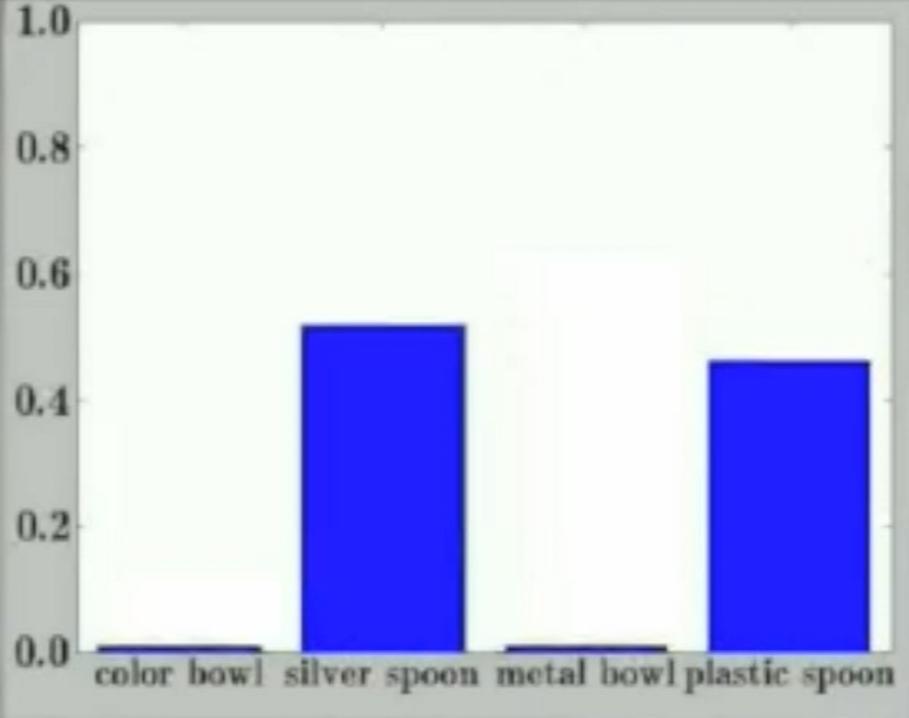

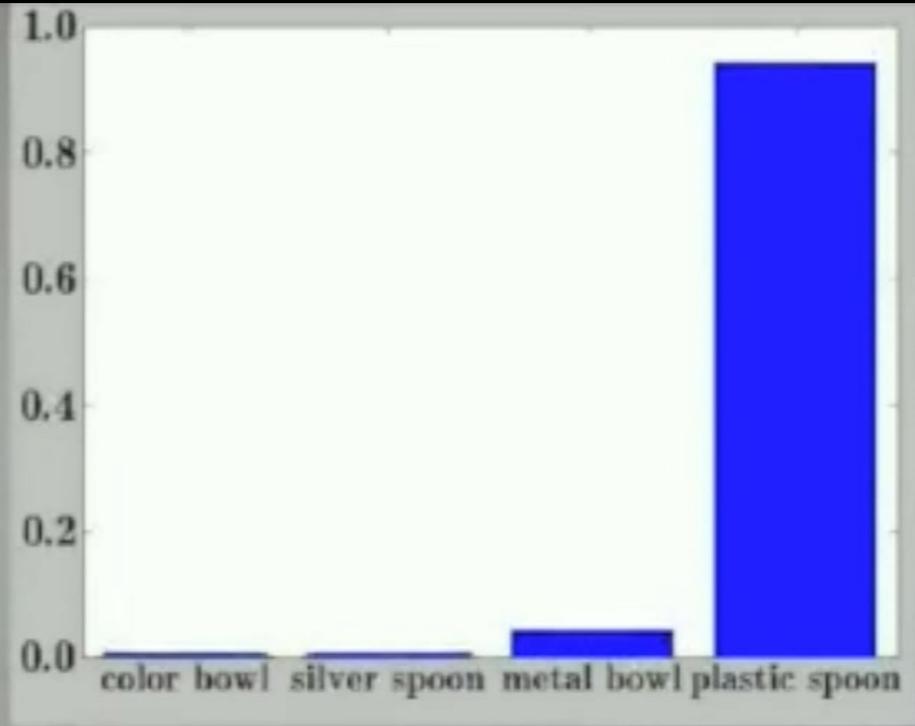

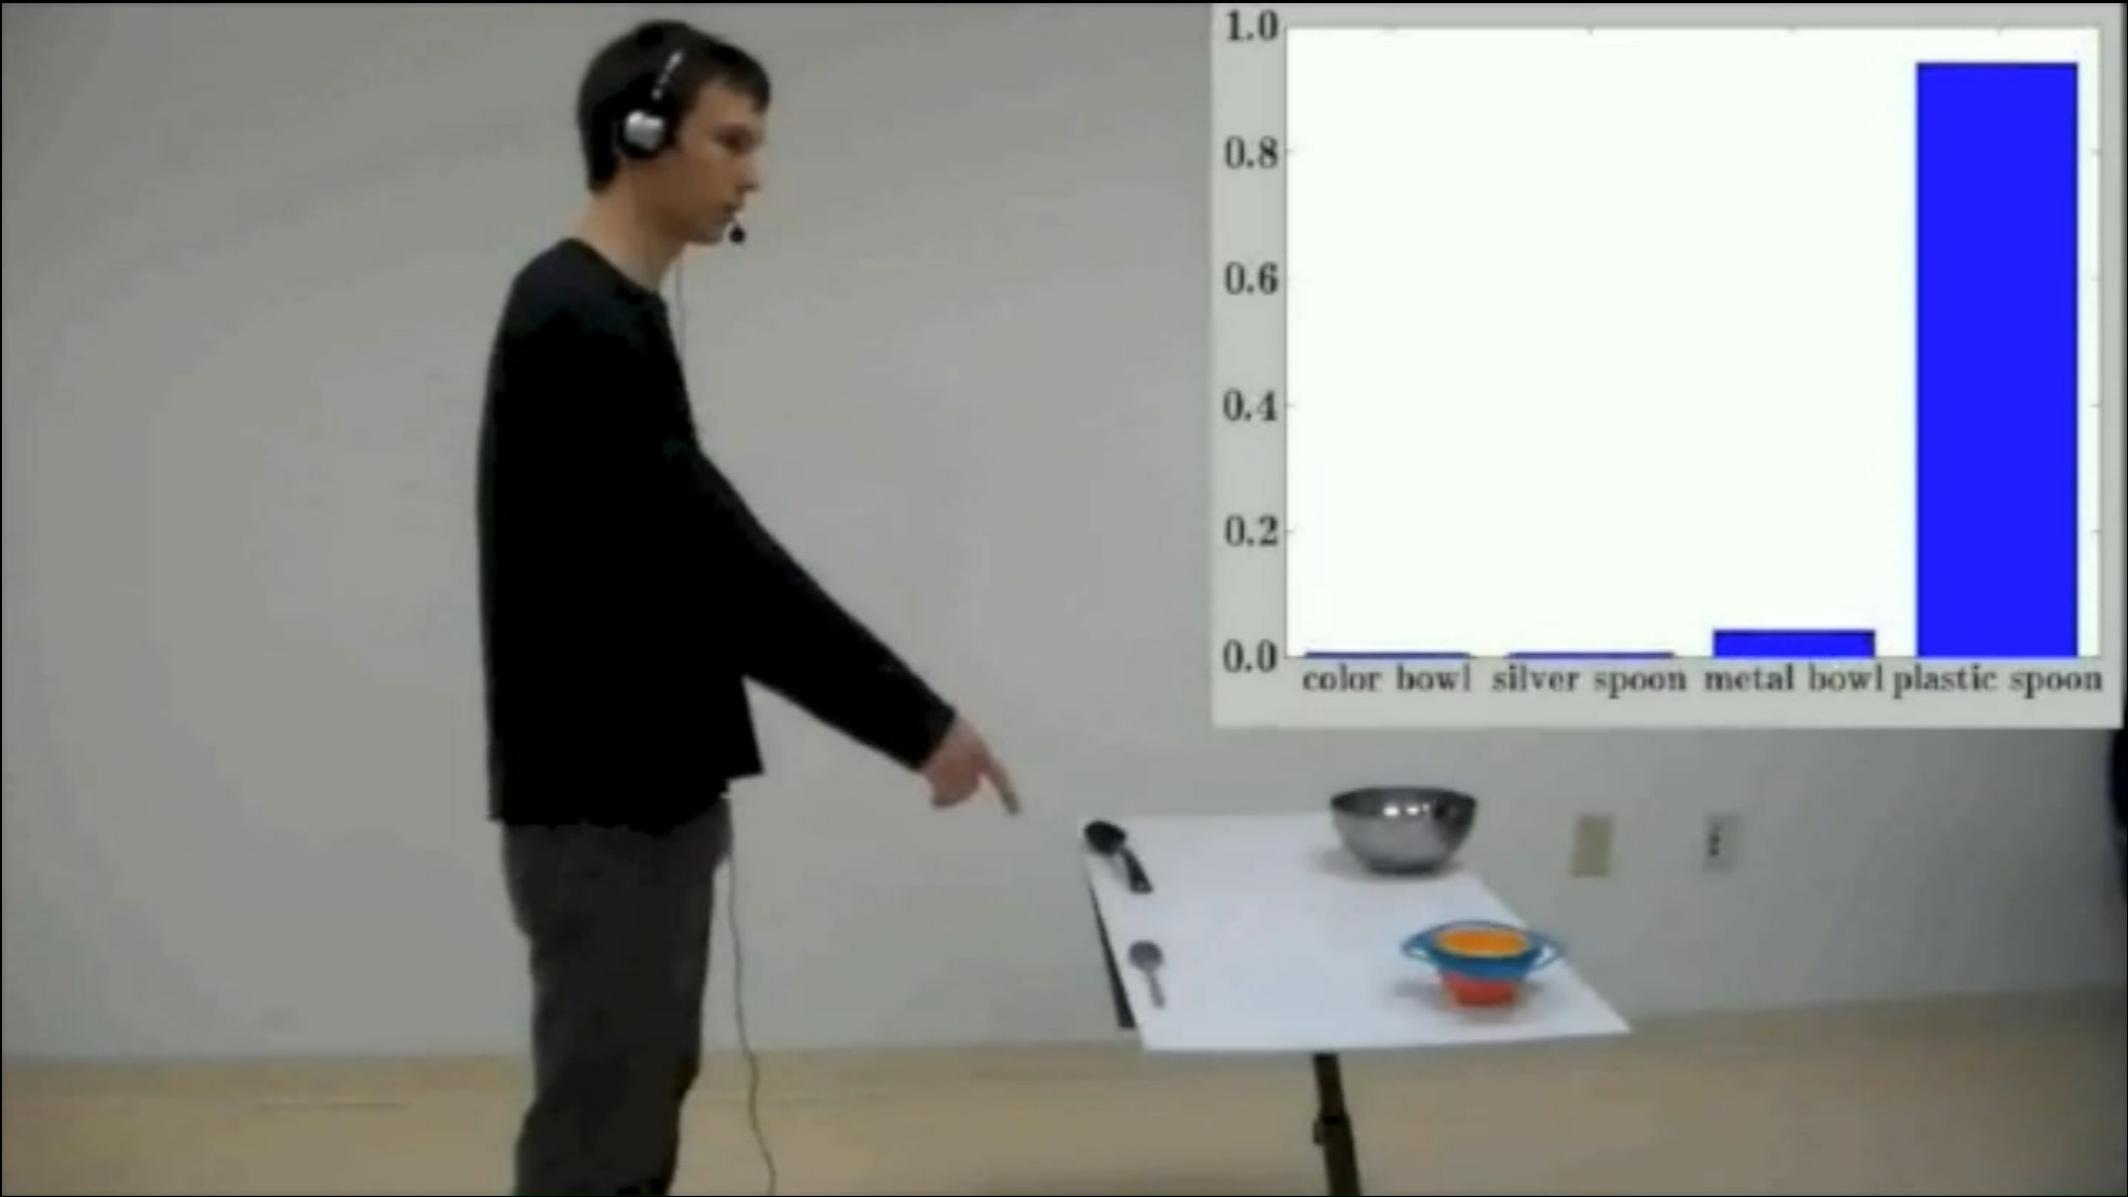

Please hand me that.

I would like a bowl.

I would like a spoon.

# Results

% correct (end of interaction)

Random	25%
Language only	46%
Gesture only	80%
Language and gesture	91%
